

Individual Performance Summary

Project Details

Project name: 09-IBM-AI-Powered Consulting Simulation — Team 1

Prepared by (PM): Gayath Wethmin Kaluwahewa

Date: 14/08/2026

Team:

1. PM – Gayath Wethmin Kaluwahewa
2. BA – Fatima Hubail
3. UX – Amritha Selvaganapathi
4. Dev1 – Kashaf Fatima
5. Dev2 – Ibrahim Allouche

Individual Team Member Reviews

Rate each person on Communication, Responsiveness, and Quality of Work using: 0 (creates blockers), 1 (adequate) & 2 (On time, clear and effective). Then add one overall comment — specific and evidence-based, referencing actual tasks or deliverables, not a general impression.

Gayath Wethmin Kaluwahewa — PM

Tasks owned: Coordinated the team throughout the mock sprint; wrote and assigned board cards to each role; ran team check-ins to track progress; reviewed completed work and signed off/marked tasks Done on the Planner board in line with the "PM writes the cards and signs off last" rule.

Communication	Responsiveness	Quality of Work
2	2	2

Comments: Kept the team aligned by assigning tasks clearly on the Planner board and following up in Teams chat when updates were needed. Responded promptly to teammates' questions and blockers throughout the sprint, keeping the board moving without cards stalling in one bucket. Reviewed each teammate's deliverable against its acceptance criteria before marking it Done, ensuring the final board accurately reflected completed work rather than just described intentions.

Fatima Hubail — BA

Tasks owned: Wrote requirements for the team page and login styling (fields, layout, scope boundary confirming login work was styling-only). Validated the UX design against those requirements once mock-ups were delivered, checking placeholder-avatar and long-blurb edge cases were covered before sign-off.

Communication	Responsiveness	Quality of Work
2	2	2

Comments: Delivered the requirements doc on schedule and flagged the styling-only login scope clearly up front, which kept Dev 1 from touching auth logic unnecessarily. The design validation pass caught both edge cases (placeholder avatar, long blurb) before build started rather than after, avoiding rework later in the sprint.

Amritha Selvaganapathi — UX

Tasks owned: Produced the Figma mock-ups for the restyled login page and the team page layout, incorporating the placeholder-avatar and long-blurb edge cases BA flagged in the requirements.

Communication	Responsiveness	Quality of Work
2	2	2

Comments: Turned the BA's requirements into mock-ups that passed validation with no changes requested, which meant Dev could build straight from the Figma file without back-and-forth. Edge cases were addressed at the design stage rather than left for Dev to guess at during implementation.

Kashaf Fatima — Dev 1

Tasks owned: Built and styled the login page to the approved design, confirming auth logic, validation, and session handling were left untouched. Later tested edge cases on the deployed build — invalid login, direct team-page access without a session, a missing photo, and an unusually long blurb, with no bugs found.

Communication	Responsiveness	Quality of Work
2	2	2

Comments: Delivered the login restyle without touching any auth logic, respecting the sprint's hard scope boundary. Testing edge cases on the deployed URL rather than localhost caught the real, production-like behaviour of the redirect and session handling, and the clean report meant no rework was needed before PM sign-off.

Ibrahim Allouche — Dev 2

Tasks owned: Built the team page and auth redirect member cards with photo/role, about-us blurb with expand-on-long-text, login redirecting to the team page on success, and a route guard redirecting unauthenticated direct access back to login. Tested the full login → redirect → team page happy path on the deployed URL, confirming all member cards rendered correctly.

Communication	Responsiveness	Quality of Work
2	2	2

Comments: Delivered the team page and route guard as specified, including the expand-on-long-text handling UX's design called for. Left a clear handoff note pointing Dev 2 to test against the deployed URL rather than localhost, which meant testing reflected real production behaviour from the start.

PM Sign-Off
