Revision History

Name	Date	Reason for changes	Version

1. Introduction

1.1 Purpose

This Software Requirements Specification (SRS) defines the requirements for a small scale frontend feature built using the existing Garage Boilerplate provided by the RMIT Capstone team.

This feature consists of a styled login page that is built using the existing authentication functionality and redirects successfully authenticated users to a team page that displays the team's information and members.

1.2 Scope

The feature includes:

- Restyling the current login page,
- Preserving the existing authentication functionality,
- Redirecting users to the team page after a successful login (and authentication),
- Creating a team page that displays the team's name and member information,
- Restricting access to the team page to only authenticated users,
- Handling identified content and authentication edge cases.

This feature will include no changes to the authentication logic, validation, or session handling that is currently implemented.

2. System Context

The feature is implemented within the existing Garage Boilerplate.

The existing technology stack from the Boilerplate includes:

- Next.js 16
- React 19
- TypeScript 5
- Tailwind CSS v4
- Firebase Authentication
- Firestore

The existing authentication system will be used unchanged rather than replaced or modified.

3. Users

3.1 Authenticated Users

A successfully authenticated user can:

- Log in using the login functionality,
- Be directed to the team page after authentication is successful,
- View team name and information of the team members.

3.2 Unauthenticated Users

An unauthenticated user can:

- Access the login page,
- Attempt to login.

An unauthenticated user must not be able to directly access the authentication protected team page.

4. Functional Requirements

4.1 Login Page

FR-4.1.1: The system shall provide a visually styled login page using the existing login functionality.

FR-4.1.2: The login page shall contain the existing authentication inputs and controls required by the Garage Boilerplate.

FR-4.1.3: The visual styling of the login page shall follow the approved designs shown in section 7.1.

FR-4.1.4: The existing authentication logic shall not be modified or removed as part of this feature.

FR-4.1.5: The existing login validation and error handling shall not be modified or removed.

FR-4.1.6: The login page shall use the existing login validation and error handling.

4.2 Successful Login

FR-4.2.1: When a user successfully authenticates using the existing login functionality, the system shall redirect the user to the team page.

FR-4.2.2: The redirect shall occur only after successful authentication of the login credentials given in the login form.

FR-4.2.3: The authentication and session behaviour shall remain consistent with the existing boilerplate.

4.3 Team page

FR-4.3.1: The system shall provide a team page to all authenticated users.

FR-4.3.2: The team page shall display the team's name.

FR-4.3.3: The team page shall display each team member.

FR-4.3.4: The team page shall have the name, photo, role, and a short blurb of each team member.

FR-4.3.5: The team member information shall be displayed based on the approved design in section 7.1.

FR-4.3.6: The team page shall be visually consistent with the styled login page.

4.4 Authentication Protection

FR-4.4.1: The team page shall not be directly accessible to unauthenticated users.

FR-4.4.2: If an unauthenticated user attempts to access the team page directly, the system shall redirect the user to the login page.

FR-4.4.3: A valid authenticated session shall be required to access the team page.

5. Non-Functional Requirements

5.1 Usability

NFR-5.1.1: The login and team pages shall present information clearly and consistently.

5.2 Visual Consistency

NFR-5.2.1: The login and team pages shall follow the approved design and use a consistent visual style.

5.3 Responsiveness

NFR-5.3.1: The page shall remain usable on common desktop and mobile screen sizes.

5.4 Security

NFR-5.4.1: The existing authentication and session security mechanisms shall not be weakened or bypassed.

5.5 Maintainability

NFR-5.5.1: The implementation shall follow the existing project structure and frontend conventions rather than introduce unnecessary architecture and/or dependencies.

6. Business Rules and Constraints

BR-6.1: The existing authentication implementation shall be reused.

BR-6.2: Login changes are restricted to presentation/styling, with the following remaining unchanged: authentication logic, authentication validation, and session handling.

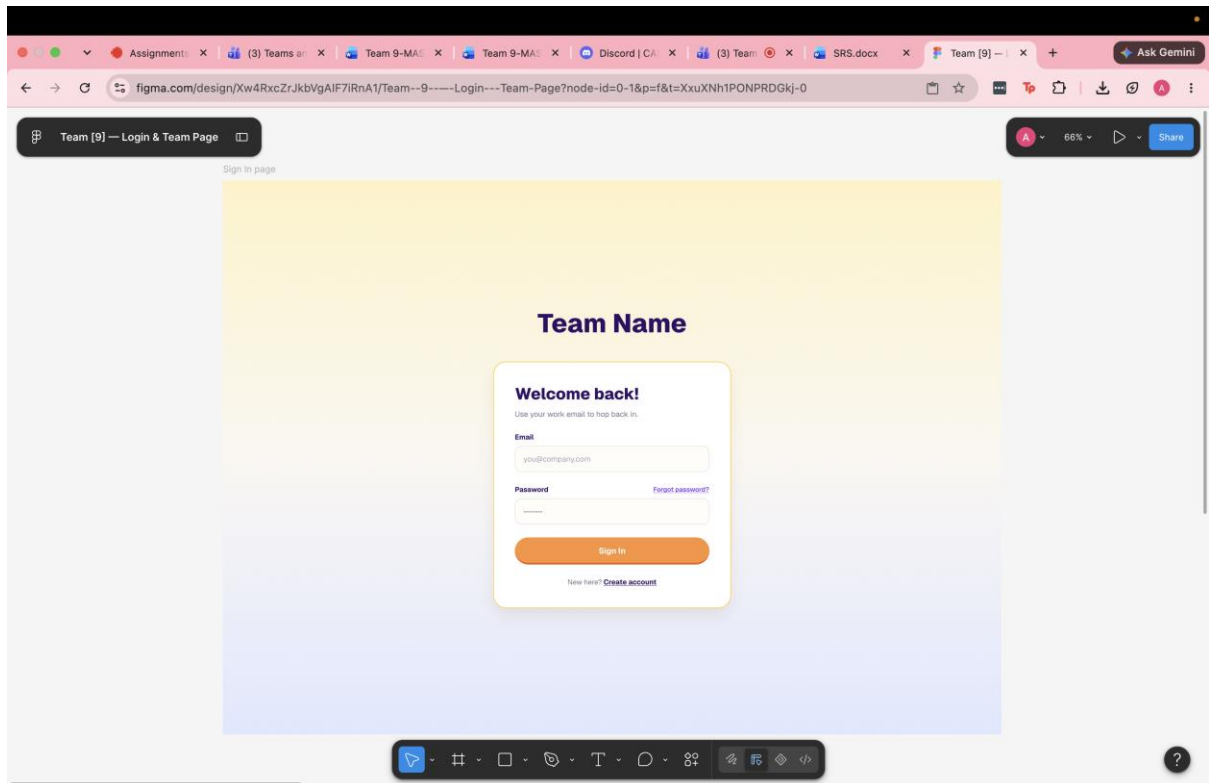

BR-6.3: Only authenticated users may access the team page

BR-6.4: The implementation shall use the existing Garage Boilerplate rather than replacing applications authentication or frontend architecture.

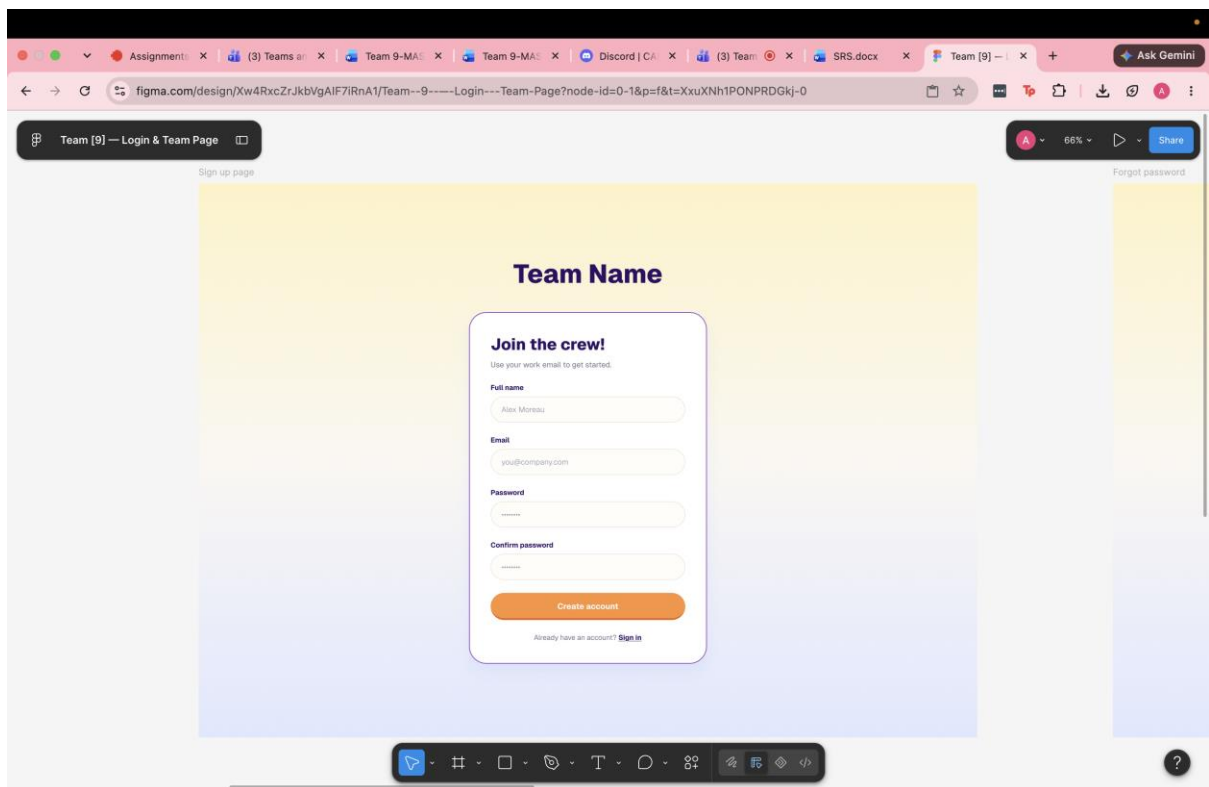

7. User Interface Requirements

7.1 Wireframes

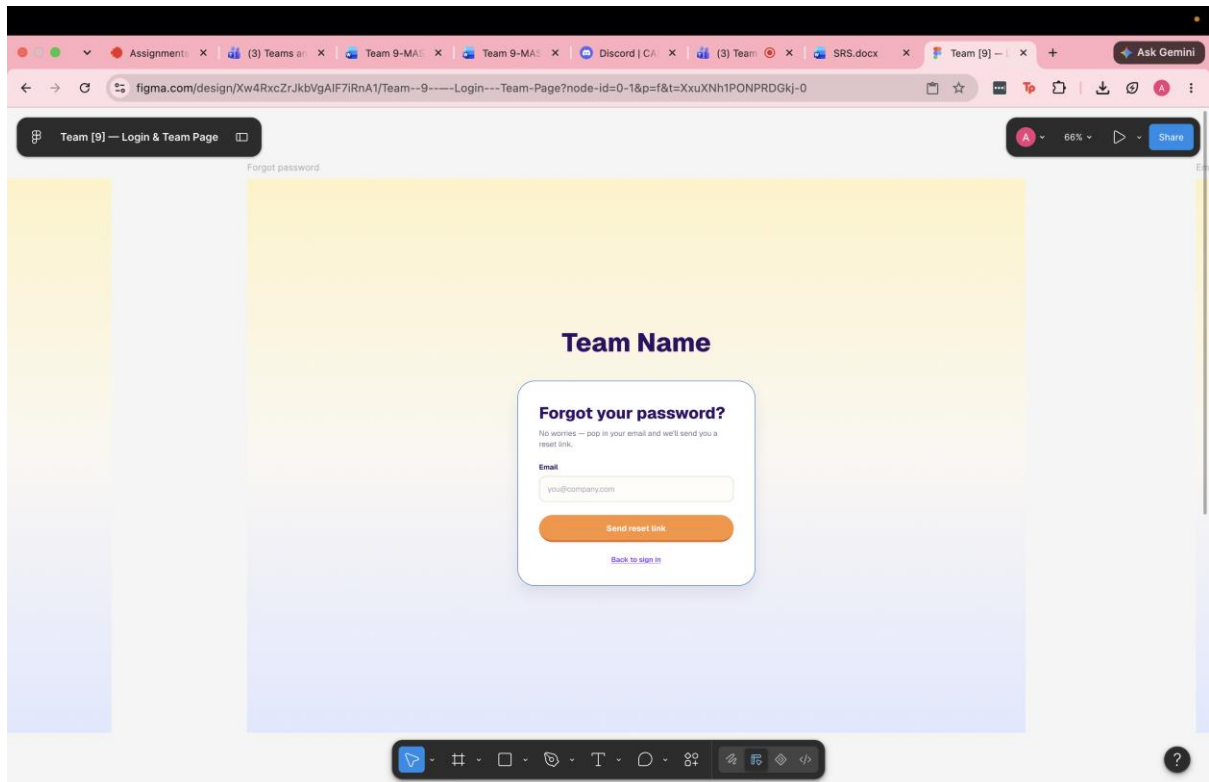

7.1.1: Login Page

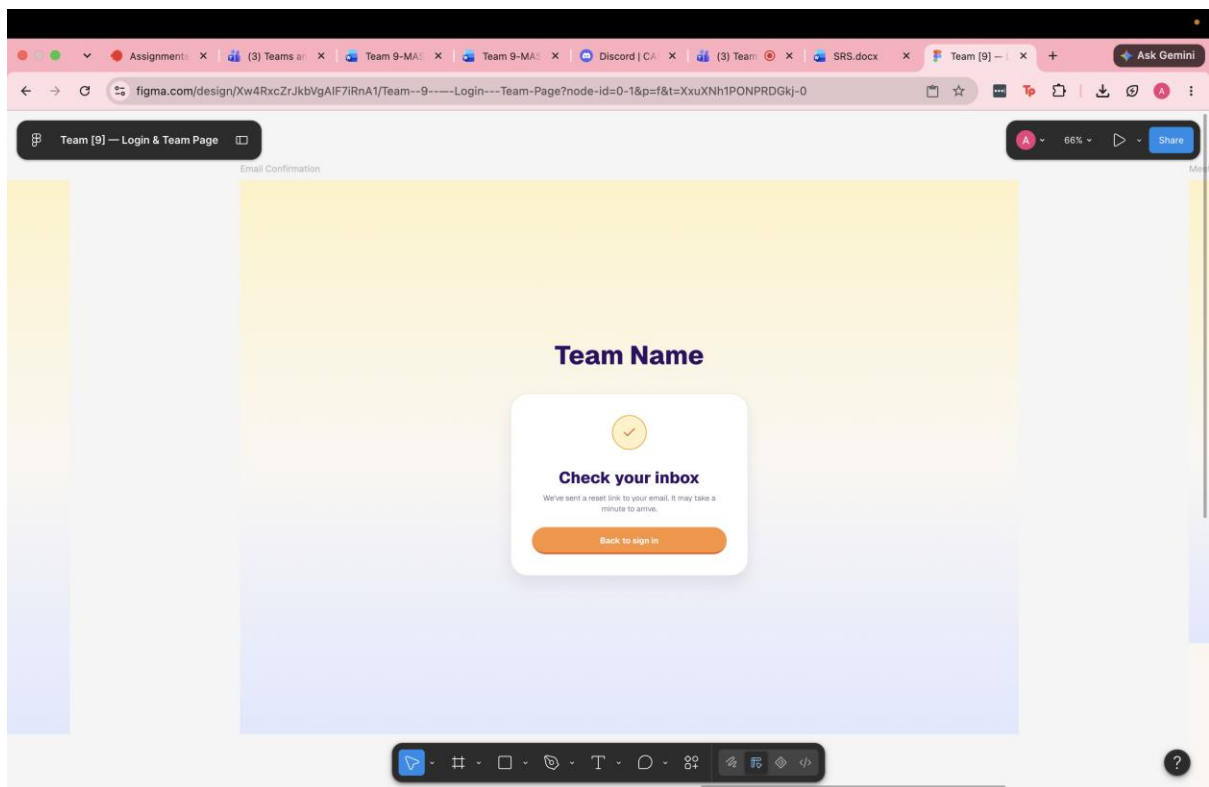

7.1.2: Sign up Page

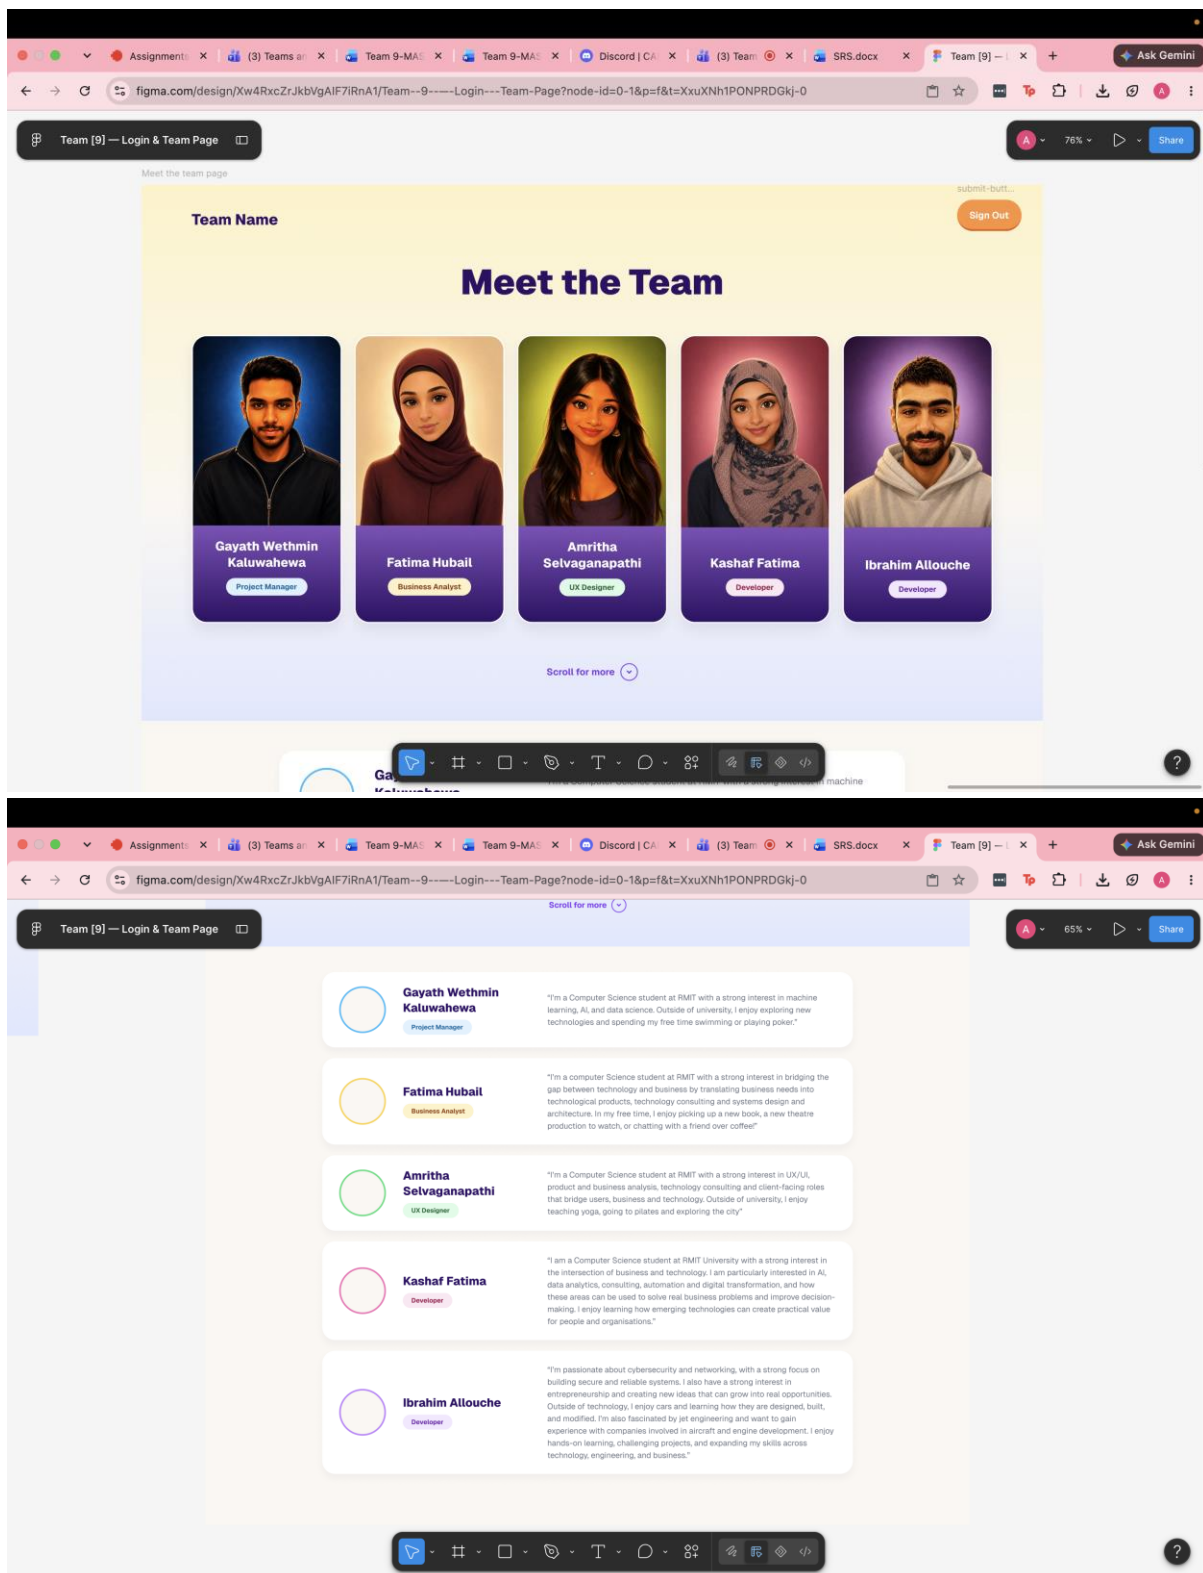

7.1.3: Forgot Password Page

7.1.4: Email Confirmation

7.1.5: Teams Page

7.2 Login Page

The login page shall:

- Use the approved login mock up.

- Maintain the existing login fields and functionality.
- Apply the approved visual styling.
- Display existing validation/error messages appropriately.
- Provide a clear and usable login experience.

7.3 Team Page

The team page shall contain:

- Team header
- Team name
- Team member cards
- Member photo
- Member name
- Member role
- Short blurb

The team page should use the same visual language as the login page.

8. Acceptance Criteria

AC-01 Login Styling:

Given the user is on the login page,

When they view the page,

Then the page matches the approved login design.

AC-02 Existing Authentication

Given the user enters valid credentials,

When they submit the login form,

Then the existing authentication process succeeds without modification to its authentication/session logic.

AC-03 Redirect

Given the user successfully logs in,

When authentication succeeds,

Then the user is redirected to the team page.

AC-04 Team Information

Given the user is authenticated,

When they view the team page,

Then they can see:

- Team name
- Each member's photo
- Each member's name
- Each member's role
- Each member's blurb

AC-05 Protected Page

Given the user is not authenticated,

When they attempt to directly access the team page,

Then they are redirected to the login page.

AC-06 Missing Photo

Given a team member does not have a photo,

When the team page is displayed,

Then the page remains visually usable and displays the defined photo fallback.

AC-07 Long Blurb

Given a team member has an unusually long blurb,

When the team page is displayed,

Then the text remains readable without breaking the layout.

AC-08 Invalid Login

Given the user enters invalid login credentials

When they submit the form

Then the existing login error behaviour is displayed,

And the user is not redirected to the team page.

9. Edge Cases

ID	Edge Case	Expected Behaviour
EC-01	Invalid login credentials	Existing authentication error is displayed; user remains on login page
EC-02	Existing login validation fails	Required-password and invalid-email validation messages appear, authentication does not proceed and existing validation remains functional.
EC-03	User accesses the Team Page while logged out	The user is redirected to sign in and protected Team Page information is unavailable.
EC-04	Sign-up passwords do not match	passwords do not match appears, account creation does not proceed, and no authenticated session is created. layout
EC-05	User completes the forgot-password flow	The reset request succeeds, the confirmation page appears, the reset email arrives, and the new password works at sign-in.
